

NAVNEET SHAHI

Site Reliability / Platform Engineer

navneetshahi345@gmail.com | +91 7068903862 | Delhi, India | github.com/Navneet072300 | linkedin.com/in/navneet-shahi

SUMMARY

SRE / Platform Engineer with hands-on production experience operating Kubernetes at scale across AWS EKS and Red Hat OpenShift. Merged contributor to ArgoCD (CNCF). Strong across GitOps (ArgoCD, Helm, Kustomize), CI/CD (GitHub Actions), infrastructure-as-code (Terraform), secrets management (HashiCorp Vault), and observability (Prometheus, Grafana). Focused on reliability, automation, and reducing operational toil in enterprise environments.

OPEN SOURCE — MERGED CNCF CONTRIBUTION

ArgoCD (CNCF, 18k+ stars) — [Merged PR #26876](#)

- Authored a custom Lua health check for `karpenter.sh/NodeClaim` (Karpenter v1), closing a node-level observability gap that left ArgoCD blind to individual node provisioning states — `NodePool` and `EC2NodeClass` had checks, `NodeClaim` did not.
- Implemented four health states (Progressing, Healthy, Degraded, Suspended) mapping node lifecycle to accurate GitOps sync status.
- Added six test cases covering all states; reviewed and approved by ArgoCD core maintainers.

PROFESSIONAL EXPERIENCE

Site Reliability / DevOps Engineer — Keen and Able Pvt Ltd

Jun 2025 – Present

Client: Coredge — AWS EKS Production Environment

- Operate and troubleshoot production workloads on AWS EKS clusters, managing deployments, namespaces, and pod lifecycle for containerized microservices.
- Built GitOps delivery with ArgoCD for automated, auditable deployments; authored and maintained Helm charts as the packaging standard.
- Engineered CI/CD pipelines in GitHub Actions covering build, test, and rolling production releases.
- Stood up Prometheus metrics/alerting and Grafana dashboards for real-time application and cluster-health monitoring, improving incident visibility.

Client: KPMG — Red Hat OpenShift Production Environment

- Deployed and operated a multi-node Red Hat OpenShift cluster in production, including OpenShift Virtualization for VM provisioning.
- Configured NGINX ingress and HAProxy load balancing; designed internal networking, storage classes, and ingress routing.

PROJECTS

Arc — Serverless PostgreSQL-as-a-Service · FastAPI, AWS EKS, Terraform, Next.js, PgBouncer, GitHub Actions

- Built a self-hosted serverless Postgres platform on EKS with scale-to-zero (idle instances → 0 replicas, PVC retained; ~15s auto-resume) via APScheduler.
- Delivered PITR (WAL archiving to S3), streaming read replicas, HMAC-SHA256 signed webhooks with exponential backoff, and per-instance CPU/memory metering every 60s.
- Provisioned full AWS infra (VPC, EKS, RDS, ECR) with Terraform modules; deployed API with HPA (2–10 pods) and PodDisruptionBudget.

Relay — Cloud Deployment Platform (Render/Railway-style PaaS) · Go, Next.js, Kubernetes, NATS JetStream, Redis, Kaniko, gVisor, OpenTelemetry

- Designed and built a control-plane / data-plane PaaS where a user connects a GitHub repo, sets env vars, and gets a live URL — with a strict deployment state machine (pending → building → deploying → live) and per-build ephemeral Kaniko Jobs.
- Built the async architecture on NATS JetStream with Redis-backed idempotency, deduplication, and distributed locks; implemented zero-downtime deploys with automatic metric-gated rollback.
- Instrumented full observability (Prometheus, Grafana, Loki, Tempo, OpenTelemetry) including trace propagation across the message queue, and hardened multi-tenant isolation with gVisor sandboxing, default-deny NetworkPolicies, and Trivy image scanning.
- Load-tested with k6 to find bottlenecks empirically, then resolved proven constraints (e.g. Postgres connection exhaustion via PgBouncer) with before/after metrics.

TECHNICAL SKILLS

Orchestration & GitOps: Kubernetes, OpenShift, ArgoCD, Helm, Kustomize, Docker
Cloud & IaC: AWS (EKS, EC2, IAM, VPC, S3, Route53), Terraform
Reliability & Observability: Prometheus, Grafana, HashiCorp Vault, NGINX, HAProxy, Load Balancing
CI/CD & Languages: GitHub Actions, Python, FastAPI, Bash, Linux, JavaScript

EDUCATION

B.E. Computer Science & Engineering (DevOps specialization), Chandigarh University 2021 – 2025 · CGPA 7.93
